

## FareStar

### Any fare, any GDS, any country

FareStar is a ground breaking proprietary tool developed by GlobalStar in association with our partners around the world. The system will allow GlobalStar consultants to search a global database with fares from every country where there is a GlobalStar partner, as well as searching every Global Distribution System (GDS). This allows you to benefit from the different IATA rules around the world, as well as any fare discrepancies between the different GDS.

### Global search, local deals

Most airlines still negotiate locally to distribute their best fares and in the past the only way to access these deals was to call, e-mail or fax a local representative in each market. By establishing a network of top quality TMC's in every key travel market in the world and then providing a multi GDS database to store all of their locally negotiated fares, GlobalStar will give you access to an unprecedented number of fares. In a single search, our consultants will be able to access over 3 million fares. This excludes multiple GDS fare comparisons and Internet content.

### For example:

- FareStar will allow GlobalStar to scan multiple databases in multiple countries in a single search.
- Search every GDS – if SABRE is cheaper in the US, is it in Singapore? We'll check it out for you.

### The future

In tomorrow's environment of GDS deregulation and potential content fragmentation, it's possible that your preferred carrier will be available on one GDS and not another. FareStar operates like a super GDS that overrides local GDS policies and restrictions, accommodates all GDS and makes contracted fares from specific markets available the moment they are scripted. As airline availability policies differ per continent, FareStar will provide seat availability from systems in other than the booker's home market or even continent. GlobalStar partners will have at their fingertips access to the most powerful and complete source of airline seat availability. FareStar will enable GlobalStar to conduct multi-GDS searches on your behalf, accessing your preferred content regardless of source.
